Kotlin static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your KOTLIN code

All rules 98 | Vulnerability 10 | Bug 17 | Security Hotspot 15 | Code Smell 56

Tags

Search by name...

Hard-coded credentials are security-sensitive
Security Hotspot

Cipher algorithms should be robust
Vulnerability

Encryption algorithms should be used with secure mode and padding scheme
Vulnerability

Server hostnames should be verified during SSL/TLS connections
Vulnerability

Server certificates should be verified during SSL/TLS connections
Vulnerability

Cryptographic keys should be robust
Vulnerability

Weak SSL/TLS protocols should not be used
Vulnerability

"SecureRandom" seeds should not be predictable
Vulnerability

Cipher Block Chaining IVs should be unpredictable
Vulnerability

Hashes should include an unpredictable salt
Vulnerability

Regular expressions should be syntactically valid
Bug

"runFinalizersOnExit" should not be called
Bug

Redundant pairs of parentheses should be removed

Analyze your code

Code Smell | Major | confusing

The use of parentheses, even those not required to enforce a desired order of operations, can clarify the intent behind a piece of code. But redundant pairs of parentheses could be misleading, and should be removed.

Noncompliant Code Example

```
val x = (y / 2 + 1)  // Compliant even if the parenthese

if (a && ((x + y > 0))) {  // Noncompliant
  //...
}

return ((x + 1))  // Noncompliant
```

Compliant Solution

```
val x = (y / 2 + 1)

if (a && (x + y > 0)) {
  //...
}

return (x + 1)
```
