Kotlin static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your KOTLIN code

All rules 98 Vulnerability 10 Bug 17 Security Hotspot 15 Code Smell 56

Tags

Search by name...

Hard-coded credentials are security-sensitive

Security Hotspot

Cipher algorithms should be robust

Vulnerability

Encryption algorithms should be used with secure mode and padding scheme

Vulnerability

Server hostnames should be verified during SSL/TLS connections

Vulnerability

Server certificates should be verified during SSL/TLS connections

Vulnerability

Cryptographic keys should be robust

Vulnerability

Weak SSL/TLS protocols should not be used

Vulnerability

"SecureRandom" seeds should not be predictable

Vulnerability

Cipher Block Chaining IVs should be unpredictable

Vulnerability

Hashes should include an unpredictable salt

Vulnerability

Regular expressions should be syntactically valid

Bug

"runFinalizersOnExit" should not be called

Bug

"ScheduledThreadPoolExecutor" should not have 0 core threads

Analyze your code

Bug Critical ?

java.util.concurrent.ScheduledThreadPoolExecutor's pool is sized with corePoolSize, so setting corePoolSize to zero means the executor will have no threads and run nothing.

This rule detects instances where corePoolSize is set to zero, via either its setter or the object constructor.

Noncompliant Code Example

```
fun do() {  
  
    val stpe1 = ScheduledThreadPoolExecutor(0) // Noncompliant  
  
    val stpe2 = ScheduledThreadPoolExecutor(POOL_SIZE)  
    stpe2.corePoolSize = 0 // Noncompliant  
  
    ...  
}
```
