Weak SSL/TLS protocols should not be used		Vulnerability
"SecureRandom" seeds should not be predictable		Vulnerability
Cipher Block Chaining IVs should be unpredictable		Vulnerability
Hashes should include an unpredictable salt		Vulnerability
Regular expressions should be syntactically valid		Bug
"runFinalizersOnExit" should not be called		Bug

## "runFinalizersOnExit" should not be called

Analyze your code

 Bug    Critical   

Running finalizers on JVM exit is disabled by default. It can be enabled with `System.runFinalizersOnExit` and `Runtime.runFinalizersOnExit`, but both methods are deprecated because they are inherently unsafe.

According to the Oracle Javadoc:

It may result in finalizers being called on live objects while other threads are concurrently manipulating those objects, resulting in erratic behavior or deadlock.

If you really want to execute something when the virtual machine begins its shutdown sequence, you should attach a shutdown hook.

### Noncompliant Code Example

```
fun main() {
    ...
    System.runFinalizersOnExit(true) // Noncompliant
    ...
}
```

### Compliant Solution

```
fun main() {
    Runtime.getRuntime().addShutdownHook(object : Thread() {
        override fun run() {
            doSomething()
        }
    })
}
```

### See

- [CERT, MET12-J](#) - Do not use finalizers. Although this resource talks about Java, the underlying information concerning the JVM are just as relevant for Kotlin.
