Go static code analysis

Unique rules to find Bugs, Security Hotspots, and Code Smells in your GO code

Tags

Hard-coded credentials are securitysensitive Security Hotspot **Cognitive Complexity of functions** should not be too high Code Smell String literals should not be duplicated Code Smell Functions should not be empty Code Smell All branches in a conditional structure should not have exactly the same implementation 📆 Bug "=+" should not be used instead of "+=" 📆 Bug Related "if/else if" statements should not have the same condition 📆 Bug Identical expressions should not be used on both sides of a binary operator 📆 Bug

All code should be reachable

Variables should not be self-assigned

Functions should not have identical

Two branches in a conditional structure should not have exactly the

same implementation

implementations

Code Smell

A Code Smell

Analyze your code Track uses of "FIXME" tags cwe FIXME tags are commonly used to mark places where a bug is suspected, but which the developer wants to deal with later. Sometimes the developer will not have the time or will simply forget to get back to that tag. This rule is meant to track those tags and to ensure that they do not go unnoticed. **Noncompliant Code Example** func foo() { // FIXME See • MITRE, CWE-546 - Suspicious Comment Available In: sonarcloud 🔂 | sonarqube

"switch" statements should not have too many "case" clauses
Track uses of "FIXME" tags
☼ Code Smell
Redundant pairs of parentheses should be removed
Nested blocks of code should not be left empty
Functions should not have too many parameters
☼ Code Smell
Using hardcoded IP addresses is security-sensitive
Security Hotspot
Multi-line comments should not be empty
☼ Code Smell
Boolean checks should not be inverted
Local variable and function parameter names should comply with a naming convention
☼ Code Smell
Boolean literals should not be redundant
